

My next case study will be the AI-powered university voice assistant which is my General AI Fluency track's capstone project for this internship. It is already defined as a separate project in Claude with custom instructions. The project aims to aid prospective and current students in finding the information efficiently and effectively. The backend is already completed using RAG; the frontend is still to be developed. The success of the project will be measured using the time taken by the AI to respond and the accuracy (based on the citations).
