Pressure-test prompt and output:

Portfolio Sitemap / Portfolio sitemap for AI product manager internship ▾ Free plan · Upgrade ×

My portfolio is intended for an AI Product Manager hiring AI or Software Engineering interns. My proof statement is that I can build AI-powered applications from concept to implementation. My current sitemap contains four pages: Home, Projects, About, and Contact. My goal is to encourage the hiring manager to invite me for an interview. Please act as a tutor and critique this sitemap. Does every page support my claim and desired action? What should I remove, improve, or add? Ask me questions if you think my reasoning needs improvement rather than simply giving me the answer.

Resolved to adopt Socratic tutoring approach for substantive portfolio critique

Good starting point — a four-page sitemap is a sensible default, but let's stress-test it against your actual goal rather than accept it because it's conventional.

Your proof statement is: "I can build AI-powered applications from concept to implementation." Let's hold each page up to that.

Home — What job is this page actually doing? If it's just a welcome banner and a nav menu, it's dead weight. A hiring manager skimming ten portfolios in a lunch break decides in about 5 seconds whether to keep going. So: what's the one sentence and one visual you want them to see before they've scrolled at all? Right now, do you have an answer to that, or is Home currently just a placeholder?

Projects — This is almost certainly where the actual evidence lives. Here's a question that matters more than it looks: is "Projects" one page listing several projects at a glance, or does each project get its own dedicated page/case study? Because "I can build AI-powered applications from concept to implementation" is a *process* claim, not just an output claim. A grid of screenshots proves you can ship something that works. It does not prove you can reason about a problem, make tradeoffs, or explain *why* you built it that way. Those are exactly the things an AI Product Manager cares about — they're evaluating whether you'd be a good collaborator on ambiguous problems, not just whether you can code.

So — for your best project, could you currently answer, in writing, on the site: what problem you identified, why you chose that approach over alternatives, what you'd do differently now? If not, that's a gap, not a sitemap problem, but it changes what "Projects" needs to contain.

About — Be honest with yourself: what is this page currently going to say? A lot of student portfolios use About as a dumping ground for "I'm a passionate learner who loves technology" filler. Does that sentence move someone toward inviting you to interview, or does it just take up space? What's one specific, non-generic thing About could do to support your proof statement — for example, showing *how you think* (your process, tools you gravitate to, a specific technical interest) rather than *how you feel* about technology?

Contact — Low risk, but ask yourself: is this really its own page, or could a contact method live in the header/footer of every page instead? A dedicated Contact page adds a click between "I'm convinced" and "I can reach this person." Is there a reason you want that friction, or did it just come from a template?

Now the bigger structural question: your CTA is "invite me for an interview." Where, specifically, in this sitemap, does someone take that action? Is there a clear next step (e.g., "Schedule a call," a calendar link, a direct email CTA) placed at the *end* of your strongest evidence — right after they've read a project case study — or is it only sitting passively on a Contact page they may never click to?

Before I give you my take on what to add/cut: **what do you think the weakest page is right now, and why?**

Reflection:

After reviewing Claude's feedback, I will expand my Projects page into detailed case studies that explain the problem, design decisions, implementation process, and results rather than simply displaying finished projects. This better demonstrates my ability to build AI-powered applications from concept to implementation and supports my proof statement.
